Σ

New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1, ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.

Disclosure; Fig 8; 48pp; English.

Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1, ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to

This protein or peptide fragments of it may be used in a vaccine composition for immunising an individual against HEV. Antibodies raised against these peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The putative capsid protein (AAR96089) of hepatitis E virus (HEV) Burma strain is encoded by ORF-2 (AAT27107) of the virus. PCR amplification of ORF-2 allows prodn. of capsid protein or of C-terminal regions of the capsid protein (see also AAR96091, AAR96093 and AAR96095) and expression in Spodoptera frugiperda Sf9 insect calls using a baculovirus vector provides recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as diagnostic reagents and in vaccines. The HEV Mexico strain capsid protein (AAR96090) may similarly be used. (Updated on 16-OCT-2003 to strandardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  099
                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                     120
                                                            A method has been developed for detecting hepatitis E virus (HEV) antibodies (Ab). The method comprises: (a) reacting a serum sample with a HEV peptide antigen; and (b) examining the peptide for the presence of bound Ab. where the presence of bound Ab indicates the presence of HEV Ab. The present sequence represents the protein from the open reading frame, ORF2, from HEV Burma strain. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-field)

The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORP) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORF1 sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for BT-NANB. (Updated on 25-MAR-2003 to correct OR field.)

mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated DNA comprising the genome of an enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (al referred as HEV). The DNA sequences or their fragments are useful in preparing BT-NANB viral proteins and as probes for virus detection. T

                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for identifying a recombinant antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody. The method comprises producing a polypeptide derived from an HEV genome, immunoreacting the polypeptide with an HEV-positive antiserum and selecting the polypeptide with an HEV-positive antiserum and selecting the polypeptide with antigen if the polypeptide reacts with the HEV-positive antiserum. The method is useful for identifying recombinant antigen immunoreactive with antibody induced by HEV. The enterically transmitted non-A/Non-B hepatitis (ET-NANB (also known as HEV))-specific fragments are useful for identifying ET-NANB. Whome the contains a patient sample, for the synthesis of polypeptides for use in immunoassays, and for identifying synthesis of polypeptides for use in immunoassays, and for identifying stimin antigens are especially useful in the preparation of vaccine against ET-NANB virus particles for use directly as antiviral antichodies to ET-NANB virus particles for use directly as antiviral angents, and to produce antiserum designed for pre- or post-exposure prophylaxis. The present sequence represents a specifically claimed HEV Burma strain protein sequence for use in the present invention

The invention comprises a method for detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a sample and isolating HEV agents or nucleic acid fragments produced by the agent. The method utilises PCR - using bile from a human or cynomolgus monkey actively infected with HEV as a source of the agent. The method of the invention is used for detecting the presence of a viral agent in a sample of cultured cells infected with the agent and isolating enterically transmitted nonA/nonB HEV agents or nucleic acid fragments produced by the agent. The present amino acid sequence represents the protein encoded by open reading frame 2 (ORF2) of a DNA sequence isolated from a Burmese strain of the Hepatitis E virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in bile samples from infected humans and monkeys using polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PFAPDVTAAAGAGPRVRQPARPLGSAWRDQAQRPAVASRRRPTTAGAAPLTAVAPAHDTP

The viral proteins are useful for detecting infection by the enterically transmitted non-A/non-B (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for producing vaccines for immunising an individual against HEV hepatitis viral agent. The DNA fragments are useful for identifying and sequencing the entire viral agent and for assaying the viral agent in an infected sample. The present sequence is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                     Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using immuno-assays and nucleic acid hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           360
                                                                                                                        This sequence represents a Hepatitis E viral hollow particle protein. This polypeptide can be used to raise antibodies to detect HEV infection in Samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than
                                                                                                                                                                                                                                                                                                                     PFAPDVTAAAGAGPRVRQPARPLGSAWRDQAQRPAVASRRRPTTAGAAPLTAVAPAHDTP 120

AAW71209-11 represent the proteins encoded by the open reading frames (ORFs) of the DNA sequence of the Burmese isolate of an enterically transmitted nonA/nonB viral hepatitis agent (ET-NANB). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV), detecting ET-NANB in infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in vaccines. (Updated on 25 MAR-2003 to correct PF field.)

DB

```
RNA from an HEV strain isolated in the Xinjiang region of China was subjected to RT-PCR to obtain fragments corresp. to ORF2 (given in AAQ86592) and ORF3 (AAQ86593) that encoded antigenic proteins (AAR70123-24, respectively). DNA fragments were manipulated into pGEX vectors for production of GST fusion proteins in E. coli. Applications include HEV infection diagnosis, therapy and vaccine development. (Updated on 25-MAR-2003 to correct PN field.)

```

The present sequence is the protein prod. of ORF-2 from the hepatitis E Virus (HEV) strain SAR-55, which was implicated in an enterically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the detection of HEV antibodies (pref. 1gG or 1gM) in blood, plasma, sera, cerebrospinal fluid, tissue, urine or pleural luid. The protein, and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than 50 kD following SDS-PAGE of cell lysaces of insect cells infected with a HEV ORF-2 contg. boculovirus, i.e. the claimed recombinant expression vectors pPIC9-1779, -1780 and -1781 Isolated and purified hepatitis E virus strain SAR-55 DNA - encodes antigenic protein useful in diagnosis, prophylaxis and treatment of hepatitis E virus infection. New isolated swine hepatitis E virus - used to develop products for th diagnosis, prevention and treatment of hepatitis E virus infection in mammals, particularly humans.

Example 1; Fig 3A; 70pp; English.

mutants which are capable of cross reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of calls or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or This invention describes a swine hepatitis E virus (HEV) and its natural contamination

Mol. Cell. Biol. 16:3264-3274(1996).
PUNCTION: Seems to be involved in the correct timing of cell
separation after cytokinesis, as separation of mutant daughter
cells is delayed. Could either be an enzyme necessary for glucans-
degradation of the cell wall at the neck region between mother and
daughter cells or a requiatory protein controlling this metabolic
step. Exclusively expressed between the end of mitosis and early
G1; inactivated before cells pass start.
